## WORK EXPERIENCE

### Angular Developer

Blue Marble Smartware

01/11/2021 - Present

As an Angular developer, I built and maintained responsive web applications, integrating with APIs to deliver seamless functionality. I converted web apps to mobile using Capacitor and collaborated with teams to translate business requirements into efficient technical solutions. Focused on code quality and performance, I contributed to code reviews and resolved front-end issues, enhancing the overall user experience while staying updated with the latest industry trends.

## PROJECTS

### MDR Mobile App

Developed the MDR mobile application, a health and medical tracking tool, using Angular and Capacitor. This project focuses on monitoring daily activities to improve users' health and wellness. I contributed to the entire front-end development process, ensuring a seamless and responsive user experience across multiple devices. My role involved designing and implementing user interfaces, managing state, and integrating with backend APIs to deliver real-time data and insights.

### Endoc and Endoc Billing

Contributed as a front-end developer to the Endoc and Endoc Billing web applications, both medical-based projects used by doctors. My primary responsibility was as the sole front-end developer for the Endoc Billing application, which handles visits, payments, insurance claims, and communication between doctors and coders. I focused on creating user-friendly interfaces, ensuring smooth interactions, and integrating with APIs to facilitate seamless data exchange and functionality.

### NPM

Worked on a project focused on critical aspects of nutrition and meal planning. My contributions included developing essential modules such as the meal plan reminder system, which alerts patients to adhere to their daily dietary schedules. The application accurately tracks macronutrients and micronutrients to ensure balanced nutrition. I was involved in creating and managing components for templates, food items, and ingredients. I worked on integrating APIs to enhance data exchange and functionality across the application. Ingredients facilitate the creation of food items, which are used to build templates for meal plans. The system supports both template-based and manual meal plan creation, ensuring flexibility and personalization.

## EDUCATION

### B.Sc - Computer Science

Mohamed Sathak College of Arts And Science

2018 - 2021
